BTC · +2.4% THIS WEEK
THE AMBER BLIP IS ALWAYS BITCOIN

TWO CHANGES · RISK OFF FOR 23.5 OF 168 HOURS

Bitcoin rose 2.4%. The coins did not.

Bitcoin spent the week in a range and added most of its 2.4% on Sunday. The liquid coins gave back the week before and only won some of it back at the weekend: of the 61 coins that stayed in our list all week, 31 finished higher and the median one was flat. Our Regime Board (it tells you what kind of market we are in) switched to Alt Risk Off for 23.5 hours on Thursday and Friday. Six of our calls resolved, three won and three lost.

01

YOUR WEEK IN 60 SECONDS

THE WEEK · 28 SEP TO 4 OCT 2026

Bitcoin held its range. The coins gave back the week before.

From Monday to Saturday bitcoin traded between 82,468 and 87,242 and closed every day between 83,400 and 84,900, then it added 2.1% on Sunday to finish the week up 2.4% at 86,487. The liquid coins did the opposite of the week before: on Monday the median one fell 4.1% on a 1.2% bitcoin dip, by Friday it was down 3.1% on the week after a 13% gain the week before, and two green weekend days only brought it back to about flat.

+2.4%	2	31 / 61	3W 3L
BTC, MON OPEN TO SUN CLOSE	REGIME CHANGES, BOTH NEAR THE US OPEN	COINS UP ON THE WEEK	RESOLVED RECEIPTS

IF YOU REMEMBER ONE THING

Bitcoin and the coins were two different markets this week. Bitcoin went sideways and then rose on Sunday, while the coins that had led the recovery gave back: of the 61 coins that stayed in our list all seven days, 31 finished higher and the median one was flat, up less than 0.1%, against 2.4% for bitcoin. Our Regime Board (the thing that says what kind of market we are in) is a macro rule, and this week it switched twice in 24 hours on the US stock market alone, from Rally to Alt Risk Off on Thursday and back on Friday. Only six of our calls resolved, three won and three lost, and nothing fired for 70 hours in the middle of the week.

WHAT LINED UP

- Our regime board's round trip was written down in advance. When it switched to Alt Risk Off on Thursday, our research lane noted that one ordinary up day in US stocks would switch it back, and the S&P rose 0.73% on Friday and it did.
- The Rally run that ended on Thursday lasted 240.5 hours, the longest run of any kind in our regime board's log since 28 May.
- Funding (what one side pays the other to hold a perp) stayed small all week, and on Friday the latest payment turned negative on all three majors at once, so shorts were paying longs, not the other way round.

WHERE TO STAY SHARP

- Open interest (the number of futures contracts open) in Solana on Bybit fell 21% from its 26 September high to a 30 session low on Saturday while the price barely moved and the same book on Binance fell under 3%, so one venue's number is not the whole market.
- Bitcoin's Bybit book hit a 30 session high at 14:00 UTC on Friday and lost 8.3% by the close, and on three of the five weekdays its biggest move came in the hour around the US open.
- Thin coins made the leader board. Moonriver rose 221% in a week and then gave back 37% in a day, and Quant, the 347% spike of the week before, flipped bear on the weekly chart at the Sunday close.

Resolved signal outcomes, not exchange fills. Research only; no trade execution.

02

THE REGIME BOARD · WHAT KIND OF MARKET

LIVE AT SENTINELRESEARCH.APP/TOOLS/REGIME-BOARD

Twenty three hours of risk off, both ends at the US open.

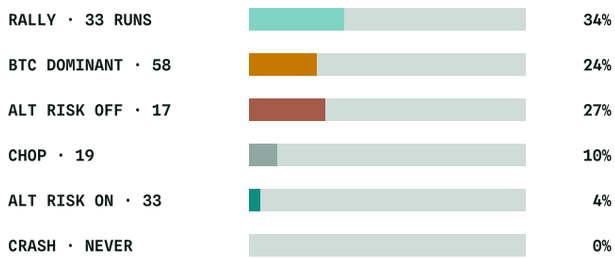

Our Regime Board reads the stock market (SPX), the dollar (DXY), bitcoin dominance (BTC.D, bitcoin's share of all crypto) and the fear index (VIX), then prints one of six market types. It had read Rally since 21 September. At 14:06 UTC on Thursday, 36 minutes after the US open, the S&P slipped under its 20 day average with the dollar already 2% above its own, and the board switched to Alt Risk Off. At 13:39 UTC on Friday, nine minutes after the next open, a 0.73% S&P day switched it back.

MARKET TYPE	FROM (UTC)	TO	HOURS
Rally	Mon 21 13:35	Thu 01 14:06	**240.5h**
Alt Risk Off	Thu 01 14:06	Fri 02 13:39	**23.5h**
Rally	Fri 02 13:39	open at Sun close	**58.3h**

The last three accepted runs. Hours in this week: Rally 144.5 and Alt Risk Off 23.5. Our pulse history shows each switch on its sample five minutes earlier (14:01:52 and 13:34:12 UTC); the accepted log, which this page prints, stamps them at 14:06:52 and 13:39:11.

SIX TYPES · SHARE OF 3,118 HOURS SINCE 28 MAY

Median run: Rally 7.3h, Alt Risk Off 7.8h, BTC Dominant 1.6h, Chop 1.1h. The log now starts on 28 May and folds flips shorter than ten minutes, so its counts are not like for like with earlier issues.

AXIS · SUNDAY CLOSE	LIVE VS REFERENCE	MARGIN	DISTANCE TO THE NEXT FLIP	STATE
SPX	7,722.72 vs MA20 7,671.30 (Friday, no weekend session)	**+0.67% of MA**	0.97% to Alt Risk Off · typical day 0.448%	up
DXY	101.92 vs MA20 100.36	**+1.55% of MA**	1.86% to flip down, which prints BTC Dominant	up
BTC.D	+0.71 pts vs MA50 on one producer	**+0.71 pts**	no change under Rally · the two producers read it 0.72 pts apart	up, banded
VIX	15.31	**calm under 18**	12.69 pts to stress, which prints Crash	calm

// A macro switch is allowed to disagree with the coins. This week it switched twice in 24 hours on the stock market alone, which is what sitting on the edge of a band looks like.

AUTHORITY THIS WEEK: 150 FRESH · 10 CONTESTED · 8 HELD BY THE BAND, OF 168 HOURLY POINTS

03

THE WEEK · SESSION BY SESSION

THE TAPE · SEVEN SESSIONS OF BYBIT USDT PERPETUALS

A give back on Monday, a range, then a green weekend.

Our research lane reads one list every day: the liquid crypto perpetual futures (perps) on Bybit, redrawn daily from the top hundred by turnover, 75 to 89 names a session. The reports for Monday to Thursday were written late, on 2 October, because four scheduled runs were missed. Their numbers come from daily data that does not change after the fact, but their list of coins was picked on 2 October.

SESSION	COINS UP	MEDIAN COIN	BITCOIN CLOSE	BTC TURNOVER	NOTE
Mon 28	12 of 75	-4.05%	83,458.6 (-1.2%)	$5.3bn	The coins gave back · collected late
Tue 29	39 of 75	+0.19%	83,628.5 (+0.2%)	$3.9bn	Steadier · collected late
Wed 30	49 of 75	+0.69%	83,573.8 (-0.1%)	$5.8bn	Solana's book drained · collected late
Thu 1	34 of 75	-0.33%	84,836.0 (+1.5%)	$5.3bn	Alt Risk Off at 14:06 UTC · collected late
Fri 2	29 of 78	-0.93%	84,475.9 (-0.4%)	$7.7bn	Rally back · BTC book flushed
Sat 3	67 of 89	+2.44%	84,716.5 (+0.3%)	$1.2bn	A broad Saturday bounce
Sun 4	60 of 85	+1.41%	86,486.7 (+2.1%)	$2.3bn	Bitcoin led a green Sunday

86,487
BTC SUN CLOSE, THE WEEK'S HIGH CLOSE

HOW WE COUNTED THE 61

Only 61 crypto perps were in our list on all seven days, bitcoin included. We chained each one's daily change from the Sunday 27 September close to the Sunday 4 October close: 31 finished higher and the median one was flat, up less than 0.1%, while bitcoin rose 2.4%. The best was NIGHT, up 63%, and the worst was US, down 51%. Counted only to the Friday close, before the green weekend, 17 of the 61 were up and the median was down 2.8%. A list that keeps only coins that stayed liquid all week leans toward survivors, and none of it is a forecast.

04

TREND FLIP SCANNER · THE WEEKLY CLOSE

LIVE AT SENTINELRESEARCH.APP/TOOLS/TREND-FLIP-SCANNER

Nine bear flips and one bull at the weekly close.

Our Trend Flip Scanner draws a trend line on every liquid coin and marks a flip when a candle closes through it. The weekly lane only changes at the Sunday close, so it is the one lane we can read exactly as the week ended. At the 00:00 UTC close on 5 October (Sunday night) it flipped one cell bull and nine bear, the first close in three with more bear flips than bull.

1 / 9
WEEKLY FLIPS AT THE 5 OCT CLOSE, BULL / BEAR

82.4%
WEEKLY BREADTH · 122 BULL, 26 BEAR

26 of 33
LAST WEEK'S BULL FLIPS STILL BULL

44
CELLS STILL ON THE 24 AUG BULL FLIP

THE 5 OCTOBER CLOSE, CELL BY CELL

Flipped bull (1): MEGA. Flipped bear (9): LYN, 2Z, LIT, MET, AT, FF, ONDO, ZEC, QNT, listed from furthest under the line. Of the 33 cells that flipped bull at the 28 September close, 26 held, 2Z and LYN went straight back to bear, and BIO, DYDX, MOVE, POPCAT and SPK have left the board's list of liquid coins. ZEC, one of the six coins Issue 005 watched flip back to bull, flipped bear again, and Quant flipped bear 14.6% under its line a week after its spike.

WHAT LINED UP

- Bitcoin's weekly cell has been bull since the 24 August close and sat 6.4% above its line at this close; ETH (7.9%) and SOL (9.0%) are bull too.
- Weekly breadth (the share of coins in a bull trend) is still high at 82.4%, only 3.4 points under last week's 85.8%.
- On Sunday 4 October our Trend Board started reading every Bybit USDT perpetual, one class at a time: 522 coins, 253 stocks and funds, 4 commodities and 3 currency pairs, on eight timeframes from 1 hour to 1 week.

WHERE TO STAY SHARP

- A flip is a line cross, not a call. ZEC has flipped bear, then bull, then bear again in four weekly closes, which is what a trend line does when the price chops across it.
- The weekly figures on this page come from the board's 148 liquid coin cells, the same list as earlier issues, not from the new every perp view.
- Stocks, commodities and currency pairs on the new view trade around the clock on Bybit while the markets they follow do not, and no study has covered them, so the board shows them as context only.

// Trend state is context, not a trade signal. A cell can only change on its own timeframe close.

THE BOARD'S OWN NOTE · BARE FLIPS DID NOT SURVIVE COSTS OUT OF SAMPLE IN OUR TESTING

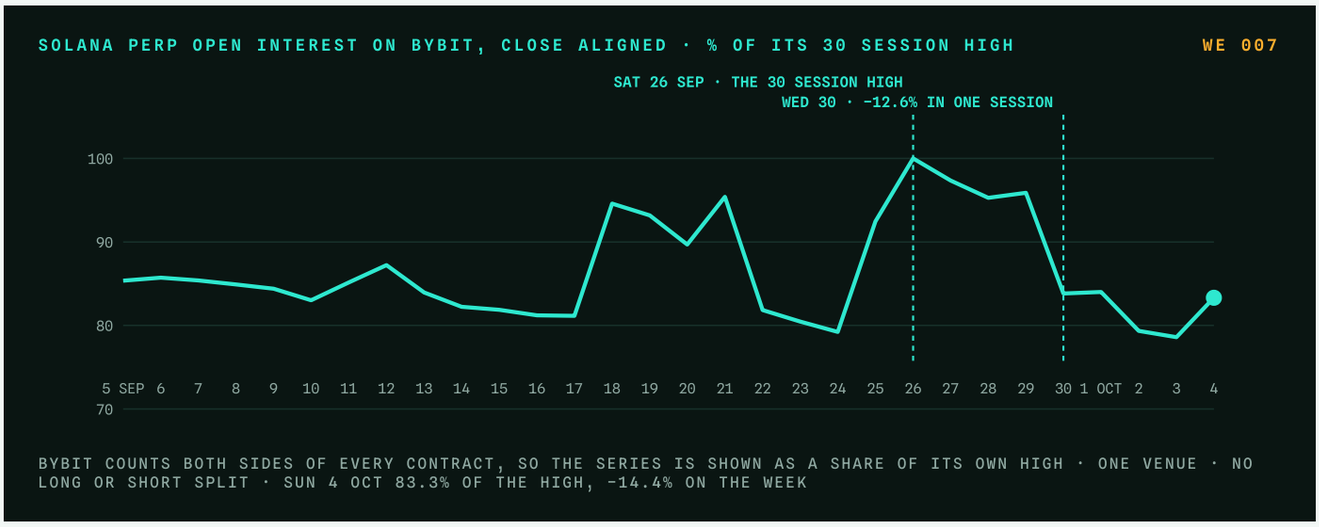

[I] FROZEN 5 OCT 00:25 UTC

05

THE DAILY INTELLIGENCE LANE · SEVEN DAILY REPORTS

Tests written in advance, answered on schedule.

Every market day an automated research run reads the tape, our own logs and the public data, and writes down what would prove it wrong before the session that decides it. This week four of those runs were missed and written late on 2 October, and there was no Sunday summary for the week before, so we read the seven daily reports directly. Here is what they found.

01 **The regime round trip was called in advance.** When our regime board switched to Alt Risk Off on Thursday, the S&P was only 0.06% under its 20 day average and the board was being held by its band in 52 of 133 samples. The research lane wrote down that one ordinary up day in US stocks, a close more than 0.3% above the average, would switch it back by Friday's close. The S&P rose 0.73% on Friday and our regime board switched back to Rally at 13:39 UTC.

02 **Solana's book unwound instead of being confirmed.** On 26 September the lane said a two day build in Solana's Bybit book would either get its price move or unwind. On Wednesday it unwound: the book fell 12.6% over about nine hours with no single hour worse than 2.5% and the price inside a 4% range, while Binance's grew 2.8%. By Saturday it was 21% under its 26 September high, a 30 session low, and on Sunday both venues added 6% on the same day, which reads as new positions across the market rather than old ones coming back.

03 **Bitcoin's book moves in the hour around the US open.** On three of the five weekdays the biggest hourly change in bitcoin's Bybit book came around the US open: down 2.0% on Monday, down 4.4% in one hour on Wednesday, more than the whole day's fall, and on Friday a build to a 30 session high at 14:00 UTC followed by an 8.3% drop to the close, with Binance's book down 3% in the same hour. Tuesday and Thursday were quiet, so it is a pattern to watch, not a rule.

04 **Quant's spike held, then the shorts came back.** Quant rose 347% in the week to 27 September on a thin book. At the registered read on the 3 October close it held its level, closing higher than on Friday with the shorts paying less to stay short, so neither of its two dated outcomes, a 15% fall out of the top ten or a squeeze still running at rank one, happened. By Sunday it was 12% down on the week, shorts were paying again, and it flipped bear on the weekly chart at the close.

05 **A 2021 gaming basket rose on a down day, for one day.** On Friday, when 63% of the coins fell, five of the ten biggest gainers on Bybit were 2021 gaming and metaverse tokens, led by Sandbox up 44.5% with shorts paying about 0.33% every eight hours to stay short. On Saturday the basket split and only Sandbox kept going, and on Sunday the leader changed to Axie, again with shorts paying. It looks like one crowded short at a time being squeezed, not a sector turning, and the registered read is the Monday 5 October close.

Here is the boundary. These are our own research runs reading public data from Bybit and, for the majors, Binance. Bybit counts both sides of every contract in its open interest, so it reads twice what Binance reports for the same positions; we print only each venue's own percentage changes, and the cross venue ratios in our daily reports from 25 September to 4 October are not used. None of it is a forecast.

06

TOOLS SHIPPED · AND THE FUNNEL

PRODUCT · WHAT WENT LIVE 28 SEP TO 4 OCT

Every Bybit perp on one board. Every Hyperliquid position beside it.

Shipped this week: the Trend Board for every Bybit perpetual and priced in bitcoin, Hyperliquid positions for members, version 2.2 of our free TradingView script, and a text checker running in shadow. Here is what each one does and what it does not.

01 **The Trend Board reads every Bybit perp.** Since Sunday 4 October (12:44 Brisbane time) the board priced in USDT reads all 783 Bybit USDT perpetuals from our own trend engine, one class at a time so they are never pooled: coins, stocks and funds, commodities and currency pairs, each with its own breadth and change feed, on eight timeframes. Its readings matched the live board on every one of the 150 coins they share.

02 **Priced in bitcoin.** From Thursday 1 October the same board can price every coin in bitcoin instead of dollars, which shows which coins are actually beating bitcoin. It covers 150 coins on four timeframes, and the daily and weekly readings were checked against TradingView's own ratio charts.

03 **Hyperliquid positions, for members.** From Friday 2 October members see the open positions on Hyperliquid, the largest on chain perps exchange, where every position is public: how much would be force closed if the price moved 5, 10 or 20%, beside a coin on the Cascade Radar, the coin panel and Telegram, and a context strip on the regime board. It is context only, nothing reads it, and the data plan ends on 19 October unless it earns its place.

04 **SENTINEL Trend 2.2 on TradingView.** Our free script now shows how long each timeframe's trend has typically lasted and how often its line flips, warns FAST LINE when a chart's line flips more than sixteen times a month, and draws the coin's own daily trend line, because the October study found a line only paid when it was slow.

05 **A checker that reads our own words.** Jev, a text checker, now reads every answer from our AI desk on Telegram and labels our news feed, in shadow: it records what it would flag and blocks nothing, so members see no change, and the news labels get their first read on or after 8 October.

06 **Eleven releases and two stalls.** Eleven releases restarted the live server this week after the Monday one failed and changed nothing. Twice, at about 06:00 Brisbane time on Saturday and Sunday, the server froze for 24 and then 48 seconds. Both were traced to the nightly model retrain pulling a full backup and a fix is in progress. On Monday morning the retrain passed without a stall, but a separate 20 second stall on Sunday afternoon Brisbane time is still being traced.

THE FUNNEL, MEASURED

Trial starts in the last 30 days: **0**, the fourth full issue in a row. Subscribers: 6, of which 2 active, one of those a comped research seat. X followers 254 at the 3 October snapshot, the same as on 29 September. Issue 005 went out on X on Monday 28 September as one card and one link reply; the card reached 28 impressions by the 4 October pull and none of its engagement came from outside our own account. We print this every issue so the receipts cut both ways.

FREE FOREVER

The live regime board, the full regime history, the public receipt ledger and every issue of this report.

150 ranked coins for the current market, 12 live opportunity cards, the per coin drawer, the Cascade Radar and Hyperliquid positions on the web and on Telegram.
SENTINELRESEARCH.APP/BETA · CORE FROM $39 PER 30 DAYS

07

RECEIPTS · LOSS FIRST

THE LEDGER · SENTINELRESEARCH.APP/PERFORMANCE

Six receipts. The three losses first.

Six calls resolved this week, three lost and three won. Five came from our CORE lane (Sweet, the one lane that reaches subscribers) and one from Super, a research lane that logs its calls on the public ledger but sends them to nobody. Nothing fired for 70 hours, from Wednesday 02:04 UTC to Saturday 00:06 UTC, which covered the whole day of risk off.

3W 3L SIX RESOLVED · 28 SEP TO 4 OCT — 4H CAP · NET OF 0.22% COST

Net figures are after the flat 0.22% round trip cost, and every row was registered on the public ledger within 38 minutes of firing, before the trade closed, then graded mechanically against stored prices. Delivery to subscribers is a separate receipt, so we say registered, not delivered. The closest call was US, whose row reached the ledger six minutes before it hit its stop.

SIGNAL	RESOLVED OUTCOME	RESULT	NOTE
BLAST (SUPER)	−6.38%	LOSS	Fired Sat 00:06 UTC by Super, a research lane that sends its calls to nobody, on a coin that fell 43% the day before, and it hit its stop after three hours and 48 minutes.
US	−5.49%	LOSS	Fired Wed 02:04 UTC, a day after US fell 45%, and it hit its stop after 38 minutes, six minutes after the row reached the ledger.
XPL	−1.24%	LOSS	Fired Sat 00:55 UTC, and the four hour limit ran out below entry.
Q	+0.31%	WIN	Fired Tue 08:58 UTC, the second call on Q that day, and the limit ran out just above entry.
Q	+6.34%	WIN	Fired Tue 00:07 UTC, and it hit its target after three hours and 16 minutes.
MAGMA	+10.79%	WIN	Fired Sun 00:07 UTC, the day after MAGMA fell 30%, and it hit its target after two hours and 50 minutes, the week's best.

The gate held nothing back. The gate (the rule that holds some lanes back in some kinds of market) logged no declined entry this week. Alt Risk Off covered Thursday afternoon to Friday afternoon, when nothing fired, and Rally lets every lane through.

THE BOUNDARY

Resolved signal outcomes are not exchange fills and not customer profit and loss, and six outcomes is a very small sample. Our CORE lane's pre registered study reads no outcomes until it has 100 resolved episodes, and the research lane's count at the 3 October close was 40, so these six are interim public receipts, which the registration allows, not that study.

[I] FROZEN 5 OCT 00:25 UTC

THE PLAYBOOK · WHAT THIS WEEK LEFT OPEN

Five things to watch, all dated.

Issue 006, the short issue for 21 to 27 September, carried no watch list, because it was built after that week was over and a list written with hindsight is not a test, so this page starts a fresh one. Issue 008 grades all five, whatever they say.

01 **The S&P and the board.** At the Sunday close the S&P sat 0.67% above its 20 day average, 0.97% from switching our regime board back to Alt Risk Off against a typical day of 0.45%, and the dollar was still 1.6% above its own average. We print the distance, not a direction we expect.

02 **Bitcoin's book around the US open, 5 to 9 October.** The research lane reads the biggest hourly change in bitcoin's Bybit book between 13:00 and 16:00 UTC on each of the next five weekdays, with Binance's beside it. Three step days in five again would make it a habit worth naming.

03 **Solana's Bybit book, Monday 5 October.** The registered read has one session left. A close above 6.2 million contracts on Bybit's own count, which counts both sides, would say positions came back to that venue, and on Sunday it stood at 6.05 million.

04 **Jev's news labels, on or after 8 October.** Our text checker has labelled the news feed in shadow since 1 October. Once it holds 150 stories attached to a coin, we read its labels blind against six bars set in advance, and that read decides whether members ever see them.

05 **Hyperliquid positions and the Cascade Radar, 18 to 20 October.** About 18 October we line the recorded Hyperliquid positions up against the Cascade Radar's events and say whether the data plan is worth keeping, a day before it lapses. About 20 October the radar's first registered checkpoint reads 50 spaced ignitions against 100 matched controls.

> WHY ISSUE 006 IS SHORT
>
> No routine builds this report, and Issue 006 was not built in its own week. We built it on 5 October from the same sources, filtered every read back to 21 to 27 September and read the weekly trend lane before its 5 October close, so the public archive has no gap. It lives on the site only: the week, the fifteen receipts with the seven losses first, and Issue 005's five graded. Four happened as written and the fifth is not due yet.

09

EVERY SOURCE · FROZEN 5 OCT 2026, 00:24 TO 00:25 UTC

The receipt vault.

Everything in this issue can be pulled again from the endpoints and files below. If a number here disagrees with the live site, the site is newer, and this page tells you when we read it and how we filtered it back to the week.

LEDGER	GET /api/ledger/verify (seq 1 to 5000) and ?afterSeq=5000&throughSeq=5270 (seq 5001 to 5270), snapshot bound · head seq 5270 · hash c2c4bc4134956e97f7b8b6d9333b2f1c708f4d13f9bd3d974390f11b12bb84cd · 2,808 registered, 2,462 resolved, 0 corrected · 12 events appended in the window · read 00:25:03Z to 00:25:04Z
