BTC · −3.2% THIS WEEK
THE AMBER BLIP IS ALWAYS BITCOIN

NO CHANGES · ONE RALLY RUN, 226 HOURS OLD AT THE SUNDAY CLOSE

Bitcoin fell 3.2%. Mostly in two hours.

Bitcoin lost 3.2% on the week and almost all of it went in two hours, on Wednesday and Thursday, with US stocks close to flat. Our Regime Board (it tells you what kind of market we are in) read Rally for all 168 hours, because it watches stocks and the dollar, not the coins. Of the 53 coins in our daily list all week, 17 finished higher. Twenty four of our calls resolved, thirteen won and eleven lost.

01

YOUR WEEK IN 60 SECONDS

THE WEEK · 5 TO 11 OCT 2026

Two hours did the damage. The rest of the week was repair.

Bitcoin drifted from 86,487 to 85,510 over Monday and Tuesday, then fell 2.6% on Wednesday with two thirds of it between 01:00 and 03:00 UTC, and 1.9% on Thursday with the whole move in the hour from 15:00 UTC, the busiest hour of the week at 1.4 billion dollars of turnover. The low was 80,350 at 17:00 UTC on Thursday. Friday, Saturday and Sunday were three green days on falling turnover that brought it back to 83,733, down 3.2% on the week. Ether lost 7.0% and Solana 8.4%.

BTC, MON OPEN TO SUN CLOSE	REGIME CHANGES IN 168 HOURS	COINS UP ON THE WEEK	RESOLVED RECEIPTS

IF YOU REMEMBER ONE THING

The week was a crypto only story. Both falls came with US stocks within half a percent of flat, so our Regime Board (the thing that says what kind of market we are in) never came close to switching: it reads the S&P 500, the dollar, bitcoin dominance and the fear index, and the nearest of those, the S&P, was never less than 0.6% from its switching line. A macro switch is allowed to disagree with a 5.7% down day in the median coin, and this week it did. Of the 53 coins in our list all seven days, 17 finished higher and the median one fell 4.2% against 3.2% for bitcoin, and 24 of the 53 beat bitcoin, mostly by falling less. Twenty four calls resolved, thirteen won and eleven lost, and half of them were two coins.

WHAT LINED UP

- Issue 007 asked whether one ordinary bad day in US stocks would switch our regime board back to Alt Risk Off. None came, and the S&P sat 1.5% above its 20 day average at the Sunday close, about three typical days away.
- The research lane's test of bitcoin's Bybit book around the US open closed as written: five quiet weekdays of five under its 2% rule, so the 24 September step was a one off, not a habit.
- Shorts were paid, not squeezed. Funding (what one side pays the other to hold a perp) showed short sellers paying on 37 of 81 coins after Thursday's fall, and those coins fell a median 7.3% against 4.3% for the rest, then rose less on Friday.

WHERE TO STAY SHARP

- Open interest (the number of futures contracts open) in Ether on Bybit fell 9.9% on the week to its lowest close in 30 sessions while the same book on Binance grew 0.7%, so one exchange's number told the opposite story to the other's.
- Thin coins ran again. iExec rose 186% in a week with short sellers paying every day, Starknet rose 110% into a release of 127 million locked tokens dated 15 October, and US doubled on Friday and gave all of it back by Sunday.
- The 15:00 UTC hour carried the biggest hourly change in bitcoin's Bybit book three days running, two of them weekend days with no US stock session, which is a new shape the lane is testing on 12 to 14 October.

02

LIVE AT SENTINELRESEARCH.APP/TOOLS/REGIME-BOARD

A hundred and sixty eight hours of Rally through a 5.7% down day in the coins.

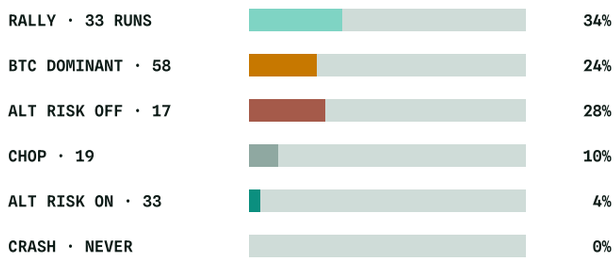

Our Regime Board reads the stock market (SPX), the dollar (DXY), bitcoin dominance (BTC.D, bitcoin's share of all crypto) and the fear index (VIX), then prints one of six market types. It has read Rally since 13:39 UTC on Friday 2 October and did not change once this week. The closest it came was Thursday: the S&P dipped to 0.6% above its 20 day average during the US session while the coins were having their worst day, and closed 1.0% above it. Rally lets every one of our lanes through, so nothing was held back by the regime.

MARKET TYPE	FROM (UTC)	TO	HOURS
Rally	Mon 21 Sep 13:35	Thu 01 Oct 14:06	**240.5h, the longest run on the log**
Alt Risk Off	Thu 01 Oct 14:06	Fri 02 Oct 13:39	**23.5h**
Rally	Fri 02 Oct 13:39	open at the Sun 11 Oct close	**226.3h, second longest**

The last three accepted runs. This week sat entirely inside the open Rally run, which was 226.3 hours old at the Sunday close, 14 hours short of the record run it replaced. Every one of the 168 hourly points in our pulse history read Rally on fresh data from both producers.

SIX TYPES · SHARE OF 3,102 HOURS SINCE 4 JUNE

Median run: Rally 7.3h, Alt Risk Off 7.8h, BTC Dominant 1.6h, Chop 1.1h. The log starts on 4 June in this snapshot and folds flips shorter than ten minutes, so its counts are not like for like with earlier issues.

AXIS · SUNDAY CLOSE	LIVE VS REFERENCE	MARGIN	DISTANCE TO THE NEXT FLIP	STATE
SPX	7,811.54 vs MA20 7,697.05 (Friday, no weekend session)	**+1.49% of MA**	1.79% to Alt Risk Off · typical day 0.48%	up
DXY	102.15 vs MA20 101.14	**+1.05% of MA**	1.35% to flip down, which prints BTC Dominant	up
BTC.D	+0.77 pts vs MA50 on one producer	**+0.77 pts**	no change under Rally · the two producers read it 0.44 pts apart	up
VIX	14.84	**calm under 18**	13.2 pts to stress, which prints Crash	calm

// A macro switch is not a coin switch. The coins fell 4.4% and 5.7% on their two worst days while US stocks closed down 0.2% and 0.5%, so the thing our regime board watches barely moved. That is what it is built to do, and it is also its limit.

AUTHORITY THIS WEEK: 168 FRESH · 0 CONTESTED · 0 HELD BY THE BAND, OF 168 HOURLY POINTS

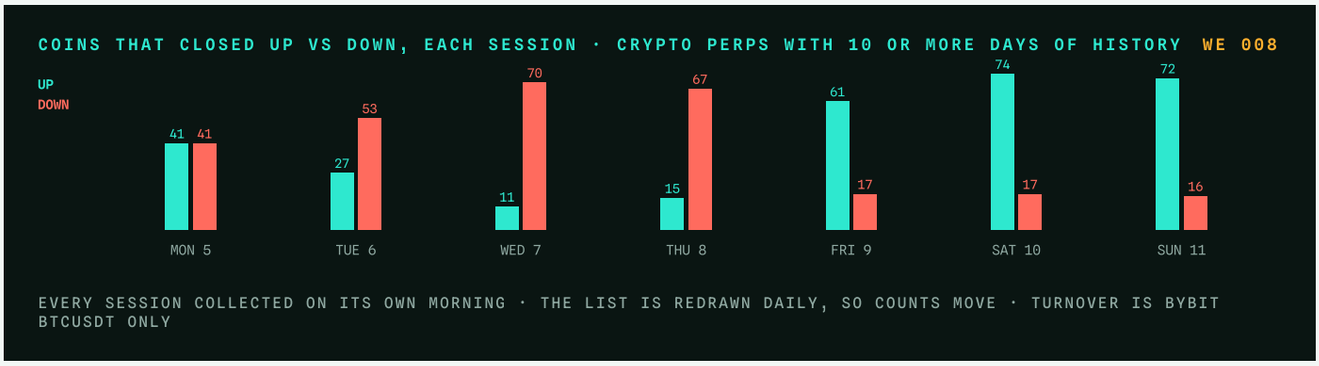

Resolved signal outcomes, not exchange fills. Research only; no trade execution.

03

THE TAPE · SEVEN SESSIONS OF BYBIT USDT PERPETUALS

Two red days, then three green ones that did not get the week back.

Our research lane reads one list every day: the liquid crypto perpetual futures (perps) on Bybit, redrawn daily from the top hundred by turnover, 78 to 91 names a session. All seven runs this week were on time and on the same rule, so unlike last week nothing here was collected after the fact. By Thursday's close the median coin was down 7.2% on the week and only 15 of 82 had risen that day. Friday, Saturday and Sunday each saw about four in five coins rise, and the median coin still finished the week down 1.7% on the lane's rolling seven day read.

SESSION	COINS UP	MEDIAN COIN	BITCOIN CLOSE	BTC TURNOVER	NOTE
Mon 5	41 of 82	-0.07%	85,725.1 (-0.9%)	$5.0bn	Half up, half down · iExec doubled
Tue 6	27 of 80	-1.67%	85,510.0 (-0.3%)	$4.0bn	Two thirds down, bitcoin flat
Wed 7	11 of 81	-4.37%	83,279.4 (-2.6%)	$5.4bn	The fall · 01:00 to 03:00 UTC
Thu 8	15 of 82	-5.66%	81,719.8 (-1.9%)	$7.5bn	The 15:00 UTC hour · the week's low
Fri 9	61 of 78	+2.70%	82,582.4 (+1.1%)	$3.6bn	A broad bounce on half the turnover
Sat 10	74 of 91	+1.76%	82,948.5 (+0.4%)	$1.1bn	The narrowest day, a 0.8% range
Sun 11	72 of 88	+2.56%	83,733.1 (+0.9%)	$1.9bn	One hour at 15:00 UTC did the day

HOW WE COUNTED THE 53

Only 53 crypto perps were in our list on all seven days, bitcoin included. We chained each one's daily change from the Sunday 4 October close to the Sunday 11 October close: 17 finished higher, the median one fell 4.2%, and 24 did better than bitcoin's 3.2% fall. Counted only to Thursday's close, 6 of the 53 were up and the median was down 10.7%, so the weekend repaired more than half of the damage. The best was iExec, up 186%, and the worst was Venice, down 18%. A list that keeps only coins that stayed liquid all week leans toward survivors, and none of it is a forecast.

04

TREND FLIP SCANNER · THE WEEKLY CLOSE

LIVE AT SENTINELRESEARCH.APP/TOOLS/TREND-FLIP-SCANNER

Seventeen bear flips and four bull at the weekly close.

Our Trend Flip Scanner draws a trend line on every liquid coin and marks a flip when a candle closes through it. The weekly lane only changes at the Sunday close, so it is the one lane we can read exactly as the week ended. At the 00:00 UTC close on 12 October (Sunday night) it flipped four cells bull and seventeen bear, the most bear flips at one weekly close since this report began counting them, and the second close in a row with more bear than bull.

4 / 17
WEEKLY FLIPS AT THE 12 OCT CLOSE, BULL / BEAR

74.1%
WEEKLY BREADTH · 109 BULL, 38 BEAR

5 of 9
LAST WEEK'S BEAR FLIPS STILL BEAR

37
CELLS STILL ON THE 24 AUG BULL FLIP, FROM 44

THE 12 OCTOBER CLOSE, CELL BY CELL

Flipped bull (4): LUMIA, MET, CHIP, MANTA, listed from furthest over the line. Flipped bear (17): USELESS, MINA, ARK, DASH, PENGU, MON, VVV, UNI, PENDLE, POL, SAND, BCH, SKY, MNT, ETC, SEI, LTC, listed from furthest under the line, Useless 33% under it and Litecoin 11%. Four of the seventeen are old large caps (Bitcoin Cash, Litecoin, Ethereum Classic and Dash) and two are the week's biggest losers in our list (Monad and Venice). Of last week's nine bear flips, five are still bear, MET went straight back to bull, and 2Z, AT and LYN have left the board's list of liquid coins. MEGA, last week's one bull flip, is still bull.

WHAT LINED UP

- Bitcoin's weekly cell has been bull since the 24 August close and sat 3.3% above its line at this close, down from 6.4% a week earlier.
- Weekly breadth (the share of coins in a bull trend) fell to 74.1% from 82.4% last week and 85.8% the week before, which is 109 of 147 cells still bull.
- The flips agree with the tape: the coins that flipped bear are the ones that fell, and a weekly flip arrives after the move, never before it.

WHERE TO STAY SHARP

- Ether (1.0%) and Solana (0.6%) are bull but within one percent of their weekly lines, so a weekly close under the line at the 19 October close would flip either of them bear. We print the distance, not a view.
- Thirty seven cells are still on the 24 August bull flip, down from 44 a week ago and 55 two weeks ago.
- A flip is a line cross, not a call. The 148 cell list is the same as earlier issues; the every perp view (783 markets) is not used for any count here.

// Trend state is context, not a trade signal. A cell can only change on its own timeframe close.

05

RESEARCH DESK · WHAT THE LANE FOUND

THE DAILY INTELLIGENCE LANE · SEVEN DAILY REPORTS AND ONE WEEKLY SYNTHESIS

Tests written in advance, answered on schedule.

Every market day an automated research run reads the tape, our own logs and the public data, and writes down what would prove it wrong before the session that decides it. All seven runs this week were on time and the Sunday synthesis was written on Monday morning, so for the first time in three issues nothing here was read late. Here is what they found.

01 **Two crypto only breaks, two hours apart in shape.** Wednesday's fall ran from 01:00 to 03:00 UTC, Tuesday evening in New York, with US stocks closing down 0.2%. Thursday's came in the single hour from 15:00 UTC, bitcoin down 2.0% and Ether down 3.8% on the week's largest hourly turnover, with the S&P down 0.5%. Nine web searches across the week found no dated cause for either, and the lane says so rather than inventing one.

02 **Shorts were paid, not squeezed.** Funding tells you which side pays to hold a perp. Short sellers were paying on 15 of 80 coins on Tuesday, 27 after Wednesday's fall and 37 of 81 after Thursday's. Those 37 fell a median 7.3% against 4.3% for the rest, and on Friday's bounce they rose 1.9% against 2.8%, so the crowd that leaned short was right and was never run over. By Sunday only 19 of 87 still paid, and those 19 sit on the week's biggest winners, which is a bet against coins that already ran.

03 **Ether's open interest on one exchange is not the market.** On Tuesday Ether's Bybit book grew 4.0% on a flat day. On Wednesday it gave that back almost exactly while Binance's grew 3.7%. Over the week Bybit's book fell 9.9% to its lowest close in 30 sessions while Binance's rose 0.7%. On Sunday both venues shed with the price up 1.2%, which is shorts closing on the way up, the opposite of a liquidation cascade. For a third week the lane's rule held: one venue's open interest is one venue's.

04 **Thin coins doubled, and about half of them kept it.** iExec doubled on Monday on 103 million dollars of turnover and finished the week up 186% with short sellers paying to stay short every day. Orca doubled by Tuesday, gave 72% of it back by Friday and its shorts left. US rose 102% on Friday and gave 123% of that gain back by Sunday. Starknet rose 110% on the week, 41% of it in five hours on Saturday while open contracts fell, into a release of 127 million locked tokens dated 15 October. The lane tested "the week's winners carry negative funding" on all seven days and discarded it each time.

05 **The 15:00 UTC hour came back in a new shape.** Issue 007 watched bitcoin's Bybit book around the US open on five weekdays. All five were quiet under the lane's 2% rule, so the 24 September step closed as a one off. Then the 15:00 UTC stamp carried the largest hourly change in that book on Friday, Saturday and Sunday, and a Sunday has no US stock session, so the old explanation cannot be the mechanism. A new test runs on 12 to 14 October.

Here is the boundary. These are our own research runs reading public data from Bybit and, for the majors, Binance. Bybit counts both sides of every contract in its open interest, so it reads twice what Binance reports for the same positions; we print only each venue's own percentage changes. Funding is read once a day at one instant on one venue. None of it is a forecast.

[I] FROZEN 12 OCT 05:16 UTC

PRODUCT · WHAT WENT LIVE 5 TO 11 OCT

Five more exchanges on the radar. Eight coins unblocked. One stall left.

Shipped this week: the Cascade Radar across six exchanges, the export fix for the morning freezes, the delivery fix that had silenced eight coins, the Trend Board priced in bitcoin on hourly bars, the site opened to US residents, and the two late issues of this report. Here is what each one does and what it does not.

01 **The Cascade Radar reads five more exchanges.** Since Friday 9 October (16:27 Brisbane time) every member row on the Cascade Radar carries the same quantities from Binance futures, Bitget, OKX, Gate and Hyperliquid beside Bybit: funding per day, open interest, what the shorts pay per day and how many venues agree, plus where the fresh shorts entered and whether they are losing, Binance positioning for the 30 hottest coins, spot flow with the Korea and Turkey shares, a dated catalyst line and the scorer's record for the coin's current cell. The detection rules are unchanged; a second rule set runs in shadow with alerts off.

02 **The server stopped freezing on the morning backup.** The 5 October release streamed the full history export in small slices instead of sorting 1.8 million rows at once, which had frozen the live server for 24, 48 and 44 seconds on three mornings. The first three retrains after it passed with no stall. Then a 21 second stall landed on 9 October inside the same window on newer code, so the fix is not finished, and we say so.

03 **Eight coins got their automatic entries back.** From Sunday 11 October a Telegram delivery that was never confirmed no longer blocks a coin on two layers while the operator route clears only one. Eight coins (GRAM, POL, BEAT, CASHCAT, WLD, COTI, ASTER and WLFI) had received no automatic entry since late September for that reason; the block now lifts itself once the position behind it is provably closed.

04 **The Trend Board priced in bitcoin now matches TradingView on 4h and 12h.** Its 4 hour and 12 hour readings are built from one hour bars the way TradingView builds them, with the same equality tolerance, proven on 35 of 35 readings against the owner's own chart. About a third of those cells changed when it shipped and said "estimate" for a few minutes while the new store filled.

05 **The site is open to US residents, and Issues 006 and 007 went up.** The legal pages are dated 11 October 2026 and the United States no longer appears on the sign up, terms or risk pages. The two issues this one follows went live on the site the same day, both built late and both saying so. This issue is the first built by a Monday routine rather than by hand.

06 **Four releases and three missed evenings.** Production restarted four times this week, on 5, 8, 9 and 11 October, under a rule of at most one restart a day while two registered studies run. The Tuesday 6 October release merged nothing because its steward misread the clock, and the 7, 8 and 9 October evening slots were lost to the laptop sleeping on battery. On Sunday the public readiness check answered "not ready" for about three minutes inside its hourly cycle on the new code; members saw nothing, and it is being read.

THE FUNNEL, MEASURED

Trial starts in the last 30 days: **0**, the fifth full issue in a row. Subscribers: 6, of which 2 active, one of those a comped research seat. X followers 251 at the 8, 9 and 10 October snapshots, down from 254 on 3 October. Two things went out on X in the window, a Monday post on altcoin breadth that reached 18 impressions with one engagement from outside our account, and one reply on Wednesday. Issue 007 goes out on X on Monday 12 October at 23:00 Brisbane time, after this freeze, so nothing about its reach is printed here. We print this every issue so the receipts cut both ways.

07

RECEIPTS · LOSS FIRST

THE LEDGER · SENTINELRESEARCH.APP/PERFORMANCE

Twenty four receipts. The eleven losses first.

Twenty four calls resolved this week, eleven lost and thirteen won, all from our CORE lane (Sweet, the one lane that reaches subscribers). Four hit their stop, two hit their target and eighteen ran out the four hour limit, nine of those below entry and nine above. Half of the rows were two coins, US and Cosmos, six calls each. Net figures are after the flat 0.22% round trip cost, every row reached the public ledger within 52 minutes of firing and before it closed, and the longest quiet stretch was 28 hours from Tuesday midday to Wednesday afternoon UTC. We say registered, not delivered, because delivery to subscribers is a separate receipt.

SIGNAL	RESOLVED OUTCOME	RESULT	NOTE
US	−6.87%	LOSS	Fired Tue 11:06 UTC, the first of six calls on US this week, and it hit its stop after 24 minutes.
ATOM	−5.60%	LOSS	Fired Thu 14:05 UTC, 55 minutes before the hour that took bitcoin down 2%, and it hit its stop after 79 minutes.
US	−5.33%	LOSS	Fired Wed 17:22 UTC, an hour after the US call below hit its target, and it hit its stop after 84 minutes.
ATOM	−3.82%	LOSS	Fired Fri 22:03 UTC, the sixth call on Cosmos (ATOM) in two days, and it hit its stop after 172 minutes.
BR	−2.90%	LOSS	Fired Wed 16:04 UTC and the four hour limit ran out below entry.
UNI	−2.13%	LOSS	Fired Sat 14:47 UTC, Uniswap flipped bear on the weekly chart the next day, and the four hour limit ran out below entry.
INJ	−1.60%	LOSS	Fired Fri 06:35 UTC and the four hour limit ran out below entry.
UNI	−1.30%	LOSS	Fired Thu 00:14 UTC, together with ARB, and the four hour limit ran out below entry.
ZEC	−1.18%	LOSS	Fired Tue 12:06 UTC and the four hour limit ran out below entry.
ARB	−1.07%	LOSS	Fired Thu 00:14 UTC, together with UNI, and the four hour limit ran out below entry.
VVV	−0.47%	LOSS	Fired Sun 16:37 UTC, the last call of the week, and the four hour limit ran out below entry.
US	+0.47%	WIN	Fired Thu 19:05 UTC and the four hour limit ran out above entry.
ATOM	+0.73%	WIN	Fired Fri 16:05 UTC and the four hour limit ran out above entry.
DOT	+1.01%	WIN	Fired Fri 16:05 UTC and the four hour limit ran out above entry.
XPL	+1.36%	WIN	Fired Sat 00:11 UTC and the four hour limit ran out above entry.
ATOM	+1.80%	WIN	Fired Thu 20:05 UTC and the four hour limit ran out above entry.
ATOM	+2.59%	WIN	Fired Fri 02:45 UTC, registered 52 minutes after firing, the week's slowest, and the four hour limit ran out above entry.
DOT	+2.80%	WIN	Fired Fri 03:46 UTC and the four hour limit ran out above entry.
CRV	+3.67%	WIN	Fired Wed 19:17 UTC and the four hour limit ran out above entry.
DOT	+3.70%	WIN	Fired Thu 22:05 UTC and the four hour limit ran out above entry.
ATOM	+3.77%	WIN	Fired Fri 07:00 UTC and the four hour limit ran out above entry.
US	+4.53%	WIN	Fired Thu 15:05 UTC and the four hour limit ran out above entry.
US	+5.97%	WIN	Fired Thu 01:06 UTC, the second call on US to hit its target, and it hit its target after 192 minutes.
US	+6.33%	WIN	Fired Wed 16:22 UTC, the week's best, and it hit its target after 54 minutes.

THE BOUNDARY

Resolved signal outcomes are not exchange fills and not customer profit and loss, and twenty four outcomes is a small sample with two coins in half of it. The gate (the rule that holds some lanes back in some kinds of market) logged no declined entry this week, because Rally lets every lane through. Our CORE lane's pre registered study reads no outcomes until it has 100 resolved episodes, and the lane's own count reached 64 at the Sunday close, so these are interim public receipts, which the registration allows, not that study.

[I] FROZEN 12 OCT 05:16 UTC

08

THE PLAYBOOK · WHAT THIS WEEK LEFT OPEN

Issue 007's five, graded. Five more, all dated.

Issue 007 set five things to watch before this week began. Four were due and four are graded below, whatever they said; the fifth is not due until 17 to 20 October. Then a fresh list for the week of 12 to 18 October, written now, before any of it is known. Issue 009 grades all five.

01 **The S&P and the board: held, as written.** Issue 007 printed the distance, 0.97% to Alt Risk Off against a typical day of 0.45%, and no direction. The S&P never closed within 1% of the line and dipped to 0.6% above it on Thursday during the session. Our regime board read Rally for all 168 hours.

02 **Bitcoin's book around the US open: a one off, closed.** The test asked whether three of the five weekdays would show a 2% hourly step in bitcoin's Bybit book between 13:00 and 16:00 UTC. None did. Five quiet weekdays of five, and the 24 September step is recorded as a one off.

03 **Solana's Bybit book on Monday: neither branch fired.** The registered read wanted a close above 6.2 million contracts on Bybit's own count by Monday 5 October. It closed at 5.91 million, down 2.3% on the day, so the positions did not come back on the dated day. They did later: five builds in a row took the book to 6.32 million by Sunday, which the test did not ask about and we do not score.

04 **Jev's news labels: not enough stories yet.** The second read on 8 October found 123 stories attached to a coin against a floor of 150, so no bar was scored and the labels stay in shadow. A counts only census on 12 October found 158, so the retry on Thursday 15 October should be a full read.

05 **Hyperliquid and the Cascade Radar: not due.** The data plan read is Saturday 17 October, the key lapses on Monday 19 October, and the radar's first registered checkpoint is about 20 October. Issue 009 will grade them.

THE NEXT FIVE · 12 TO 18 OCTOBER

01 **The 15:00 UTC hour, 12 to 14 October.** The lane reads whether the 15:00 UTC stamp carries the largest hourly change in bitcoin's Bybit book on at least two of the three weekdays. If it does not, the weekend prints were noise in a thin book; if it does, the next step is the same hour on Binance.

02 **Starknet into its token release, Thursday 15 October.** Starknet closed Sunday at 0.1231 after a 110% week, with 127 million locked tokens due to be released on 15 October. We read the 15 October close against the 11 October close and whether open contracts on Bybit built or shrank into it. A date, not a direction.

03 **Ether and Solana against their weekly lines, Sunday 18 October.** Both sit less than one percent above the line on our Trend Flip Scanner. A weekly close under it at the 19 October 00:00 UTC close flips the cell bear; a close above it does not. We will print whichever one happens.

04 **Jev's news labels, Thursday 15 October at 14:15 Brisbane time.** With 158 attached stories in the census the read should run in full: the labels are scored blind against six bars set on 1 October, and that read decides whether members ever see them.

05 **The data plan and the radar, 17 to 20 October.** Saturday 17 October we line the recorded Hyperliquid positions up against the Cascade Radar's events and say whether the plan earns its renewal before the key lapses on Monday 19 October at 09:43 Brisbane time. About 20 October the radar's first registered checkpoint reads 50 spaced ignitions against 100 matched controls.

HOW THIS ISSUE WAS BUILT

Issue 007 said no routine built this report, which is why Issues 005 and 006 were late. From this week one does: a scheduled task froze every source at 05:15 UTC on Monday 12 October, five hours after the week closed and after the weekly trend lane had swept its Sunday close, derived every number from those files, wrote these pages, rendered them, and opened the pull request that put them on the site. A person reviewed nothing before it merged; the checks did. If a number here is wrong, the receipt vault on the next page says exactly where it came from.

09

EVERY SOURCE · FROZEN 12 OCT 2026, 05:15 TO 05:16 UTC

The receipt vault.

Everything in this issue can be pulled again from the endpoints and files below. If a number here disagrees with the live site, the site is newer, and this page tells you when we read it and how we filtered it back to the week.

LEDGER	GET /api/ledger/verify (seq 1 to 5000) and ?afterSeq=5000&throughSeq=5321 (seq 5001 to 5321), snapshot bound · head seq 5321 · hash 4eb0160014e95ac8b52e1d1f1cac6d10c5458c77ed96b3b97bc30aa617e6ebd7 · 2,834 registered, 2,487 resolved, 0 corrected · 48 events appended in the window · read 05:15:59Z
ANCHORS	100 OpenTimestamps anchors listed, all 100 submitted, 0 with a Bitcoin confirmation in the payload. Newest anchor 110 covers seq 5316 to 5316. We print that number until it changes.
RECEIPTS	The 24 rows fired 5 to 11 Oct, filtered from the ledger by firing time · cross checked against GET /api/v1/signals/active?status=all&sinceHours=336 · read 05:15:58Z to 05:15:59Z
GATE	GET /api/regime-gate-receipts/rows?days=30&limit=100, filtered to the week (no rows) · admin regime gate impact 7 and 14 days, counts only · read 05:15:56Z to 05:16:05Z
REGIME	GET /api/regime-performance snapshot.segments, 160 runs since 4 June, snapshot generated 12 Oct 03:17Z, after the window, receipts null by design · GET /api/regime/pulse-history?hours=336 · GET /api/daily-brief/latest?date= for 5 to 11 Oct · read 05:15:51Z to 05:16:03Z
TREND	GET /api/scanner/trend-board (147 weekly cells, the weekly lane had swept its 12 Oct 00:00Z close, read 05:15:57Z) · the 28 Sep and 5 Oct weekly counts from the committed Issue 006 and 007 freezes
PRICES	Bybit v5 market kline BTCUSDT, ETHUSDT, SOLUSDT linear, intervals D and 60 · read 05:16:00Z to 05:16:01Z
RESEARCH	docs/research/daily-intelligence/reports 2026-10-05 to 2026-10-11 (seven daily runs, all on time) and weekly/2026-10-11-weekly-research.md · the seven market snapshot files (sha256 in derived.json) supply the session table, the 53 coin count, the open interest percentages and the Ether series
PRODUCT	docs/CURRENT_STATE.md dated sections 5 to 11 Oct (the four trains, the Cascade Radar venues, the export fix, the delivery incidents fix, the Trend Board priced in bitcoin, the US opening, Issues 006 and 007) · admin subscription funnel, 7 and 30 days, counts only · X figures from the docs/growth post performance ledger (newest pull 11 Oct 22:58Z) and the 12 Oct morning growth pack
METHOD	Every live figure was read between 05:15:51Z and 05:16:06Z on 12 Oct 2026 by the scheduled task and filtered back to 5 to 11 Oct by timestamp; /ready was not read on purpose (each call blocks the live server for seconds). Raw responses are kept with URL, HTTP status, byte count and sha256; the ledger, the trend board and the admin bodies are hashed but not committed. Net returns use a flat 0.22% round trip cost; funding and slippage are not modelled. Bybit open interest is printed as percentages only.

Here is what we do not claim. We claim no trade execution, no customer profit and loss, no hit rate for the board (the public endpoint returns receipts: null on purpose), no hit rate, average or other aggregate score for any lane, and no prediction. Corrections get a new file name, and an issued PDF is never overwritten.
