ONE CHANGE · THE 292 HOUR RALLY RUN ENDED, THE LONGEST ON THE LOG

BTC · -2.0% THIS WEEK
THE AMBER BLIP IS ALWAYS BITCOIN

Bitcoin fell 2.0%. The median coin fell 10.3%.

Bitcoin lost 2.0% on the week while the median coin in our daily list of 78 lost 10.3%. Our Regime Board (it tells you what kind of market we are in) switched from Rally to Alt Risk Off on Wednesday, when the S&P 500 closed a hair under its 20 day average, and did not switch back. Sixty six coins flipped bear at the weekly close, Ether and Solana among them. Thirty one of our calls resolved, sixteen won and fifteen lost.

01

YOUR WEEK IN 60 SECONDS

THE WEEK · 12 TO 18 OCT 2026

Bitcoin went sideways. The coins went down.

Bitcoin fell 2.3% on Monday in two steps, at noon and late evening UTC, got it all back on Tuesday morning between 01:00 and 03:00 UTC, then fell 1.8% on Wednesday from 12:00 UTC on the busiest hour of the week, 1.0 billion dollars of turnover, the same afternoon US stocks fell 1.1%. Thursday's dip to 79,750 at 13:00 UTC was bought at the New York open. Friday, Saturday and Sunday moved less than one percent each and it closed at 82,066, down 2.0% on the week. Ether lost 5.0% and Solana 6.5%.

−2.0%	1	12 / 78	16W 15L
BTC, MON OPEN TO SUN CLOSE	REGIME CHANGE, WED 18:00 UTC	COINS UP ON THE WEEK	RESOLVED RECEIPTS

IF YOU REMEMBER ONE THING

This was an altcoin drawdown under a steady bitcoin. Of the 78 coins in our list on Sunday, 12 finished the week higher, the median one fell 10.3% against 2.0% for bitcoin, and only 13 did better than bitcoin. Bitcoin's share of all crypto rose to about 60%. Our Regime Board switched to Alt Risk Off on Wednesday because the S&P 500 closed 0.08% under its 20 day average, and it stayed there: the switch names the shape of the week, it did not predict it, and it came after Monday's fall. Under Alt Risk Off the gate (the rule that holds some lanes back in some kinds of market) lets only our CORE lane through. Three of the four lanes it holds back are off for everyone and the fourth, Super, goes only to Research Lab members who signed the risk note, so no ordinary member lost an entry. Thirty one calls resolved, sixteen won and fifteen lost.

WHAT LINED UP

- Issue 008 asked whether Ether and Solana would close under their weekly trend lines. Both did, Ether 9.6% under and Solana 11.2% under, and 64 other coins joined them, the most bear flips at one weekly close this report has counted.
- The research lane's rule that open interest (the number of futures contracts open) moves one exchange at a time held for a fourth week, and this week it was bitcoin: Bybit's book grew 6.9% while Binance's grew 0.8%.
- Short sellers were paid, not squeezed, for a second week. After Monday's fall they were paying to stay short on 37 of 76 coins, and those coins moved with the tape, not against it.

WHERE TO STAY SHARP

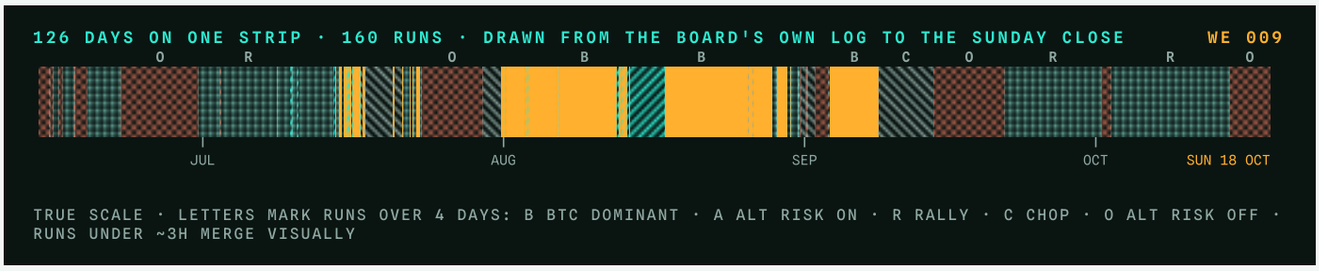

- The dollar is now the nearest switch. It sat 0.13% above its 20 day average at the Sunday reading, 0.43% from the line that flips it down and prints Chop, with a typical day moving 0.24%.
- The research lane lost two days of its own exchange data, Thursday and Friday, to a country block on the Mac's VPN exit. The session table on page three has five rows, not seven, and says so.
- The week's five bull flips are all thin coins that at least doubled (Q, ICNT, SIREN, PUFFER and TRUTH). Q rose 270% in a week. A weekly flip arrives after the move, never before it.

02

LIVE AT SENTINELRESEARCH.APP/TOOLS/REGIME-BOARD

Sixty six hours of Rally, then a hundred and two of Alt Risk Off.

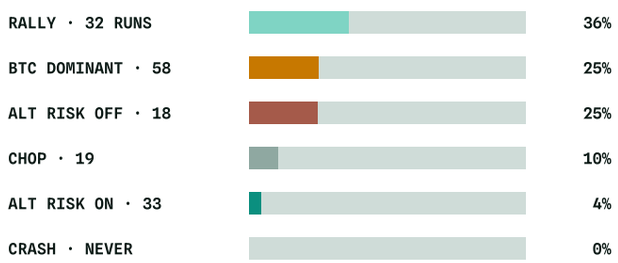

Our Regime Board reads the stock market (SPX), the dollar (DXY), bitcoin dominance (BTC.D, bitcoin's share of all crypto) and the fear index (VIX), then prints one of six market types. On Wednesday 14 October the S&P 500 fell 1.1% and closed 0.08% under its 20 day average, both producers named that axis, and the board accepted Alt Risk Off at 18:00 UTC. It sat 0.38% from flipping straight back, inside one typical day, and it did not: Thursday's rebound in stocks fell short of the line and Friday's fall took the S&P to 1.03% under it, where it stayed through the weekend. Alt Risk Off holds back four of our five lanes: three are switched off for everyone, and the fourth, Super, goes only to Research Lab members who have signed the risk note, so the switch cost ordinary members nothing.

MARKET TYPE	FROM (UTC)	TO	HOURS
Alt Risk Off	Thu 01 Oct 14:06	Fri 02 Oct 13:39	**23.5h**
Rally	Fri 02 Oct 13:39	Wed 14 Oct 18:00	**292.4h, the longest run on the log**
Alt Risk Off	Wed 14 Oct 18:00	open at the Sun 18 Oct close	**102.0h, fourth longest of its kind**

The last three accepted runs. The Rally run that Issue 008 called 226 hours old ended on Wednesday at 292.4 hours, the longest run of any kind on the log since it began on 4 June. The Alt Risk Off run that replaced it was 102.0 hours old at the Sunday close, the fourth longest of its eighteen. Of the 168 hourly points in our pulse history, 143 read fresh on both producers, one read contested at the switch itself, and 24 were held by the band.

SIX TYPES · SHARE OF 3,043 HOURS SINCE 4 JUNE

Median run: Rally 6.6h, Alt Risk Off 8.7h, BTC Dominant 1.6h, Chop 1.1h. The log starts on 4 June in this snapshot and folds flips shorter than ten minutes, so its counts are not like for like with earlier issues.

AXIS · SUNDAY CLOSE	LIVE VS REFERENCE	MARGIN	DISTANCE TO THE NEXT FLIP	STATE
SPX	7,659.44 vs MA20 7,738.79 (Friday, no weekend session)	**−1.03% of MA**	1.33% to flip up, which prints Rally · typical day 0.48%	down
DXY	101.79 vs its 20 day average, about 101.7	**+0.13% of MA**	0.43% to flip down, which prints Chop · typical day 0.24%	up
BTC.D	+1.25 pts vs MA50 · about 60.1% of all crypto	**+1.25 pts**	no change under Alt Risk Off	up
VIX	19.99	**moderate, over 18**	8.0 pts to stress, which prints Crash	moderate

// A switch a hair past the line is allowed to whipsaw, and this one did not. The S&P closed 0.08% under its average on Wednesday, 0.14% over it on Thursday, and 1.03% under it on Friday, and the board printed Alt Risk Off through all three because the producers read the band, not the sign.

AUTHORITY THIS WEEK: 143 FRESH · 1 CONTESTED, AT THE SWITCH · 24 HELD BY THE BAND, OF 168 HOURLY POINTS

Resolved signal outcomes, not exchange fills. Research only; no trade execution.

03

THE WEEK · SESSION BY SESSION

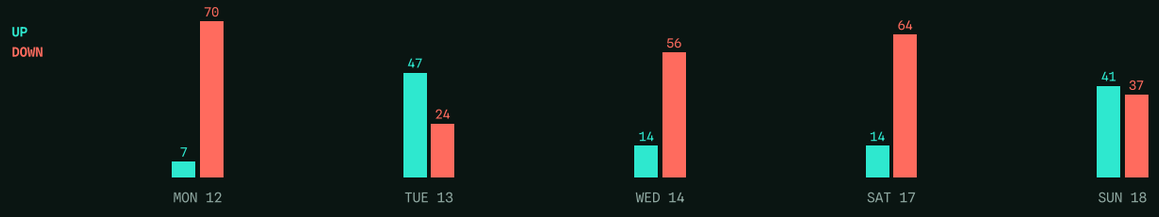

THE TAPE · SEVEN SESSIONS OF BYBIT USDT PERPETUALS, FIVE OF THEM READ

Seven of 77 coins rose on Monday. Thursday and Friday were not read.

Our research lane reads one list every day: the liquid crypto perpetual futures (perps) on Bybit, redrawn daily from the top hundred by turnover. This week the list shrank to 70 to 78 names because perpetuals on semiconductor stocks and funds took turnover slots during the chip sell off. Monday was the worst session, seven coins up and the median down 7.3%, and the median was already down 7.2% on the rolling week. Thursday and Friday have no coin count: the Mac that runs the lane was blocked by Bybit for two days because its VPN exit was in the United States, and the Saturday file was collected on Monday. Production was never blocked.

HOW WE COUNTED THE 78

With two days missing we could not chain daily moves the way earlier issues did, so this count is the Sunday file's own seven day field for each of the 78 coins in the list that morning, the move from the Sunday 11 October close to the Sunday 18 October close. 12 finished higher, the median one fell 10.3%, and 13 did better than bitcoin's 2.0% fall. The best was Q, up 270%, then ICNT up 83% and ARIA up 61%, all thin. The worst were APR, down 60%, Starknet, down 51% after its token release, and W, down 41% after a 52% gain the week before. A list drawn on Sunday leans toward whatever was liquid on Sunday, and none of it is a forecast.

04

TREND FLIP SCANNER · THE WEEKLY CLOSE

LIVE AT SENTINELRESEARCH.APP/TOOLS/TREND-FLIP-SCANNER

Sixty six bear flips and five bull at the weekly close.

Our Trend Flip Scanner draws a trend line on every liquid coin and marks a flip when a candle closes through it. The weekly lane only changes at the Sunday close, so it is the one lane we can read exactly as the week ended. At the 00:00 UTC close on 19 October (Sunday night) it flipped five cells bull and 66 bear, nearly four times the seventeen that set the record a week ago, on the same settings. Weekly breadth (the share of coins in a bull trend) fell from 74.1% to 30.2%, which is 45 of 149 cells still bull.

5 / 66
WEEKLY FLIPS AT THE 19 OCT CLOSE, BULL / BEAR

30.2%
WEEKLY BREADTH · 45 BULL, 104 BEAR

15 of 17
LAST WEEK'S BEAR FLIPS STILL BEAR

13
CELLS STILL ON THE 24 AUG BULL FLIP, FROM 37

THE 19 OCTOBER CLOSE, CELL BY CELL

Flipped bull (5): ICNT, SIREN, PUFFER, Q, TRUTH, listed from furthest over the line, every one a thin coin that at least doubled this week. Flipped bear (66): the sixteen large coins among them are ETH, SOL, XRP, BNB, DOGE, ADA, AVAX, LINK, SUI, NEAR, HBAR, XLM, HYPE, AAVE, TAO, ICP; the furthest under their lines are ARC (42%), BLUR (38%), CAP (35%), BASED (35%), and the closest are BNB (8%), ETH (10%), SOL (11%). Of last week's seventeen bear flips, fifteen are still bear and ARK and SKY have left the board's list of liquid coins. Of last week's four bull flips, CHIP and MET flipped bear at this close and LUMIA and MANTA left the list. None of the four is still bull.

WHAT LINED UP

- Issue 008 said a weekly close under the line would flip Ether or Solana bear. Both closed under, Ether 9.6% under its line and Solana 11.2%, and both flipped.
- Bitcoin's weekly cell is still bull from the 24 August close, 1.3% above its line at this close, from 3.3% a week earlier and 6.4% the week before that.
- The flips agree with the tape: the median coin fell 10.3% on the week and two thirds of the list is now under its weekly line. A weekly flip arrives after the move, never before it.

WHERE TO STAY SHARP

- Only 13 cells are still on the 24 August bull flip, from 37 a week ago and 55 three weeks ago. Bitcoin is one of them.
- Breadth of 30% is less than half of what it was two weeks ago. We print the number, not a view on what a low number means, because bare flips did not survive costs in our own testing.
- A flip is a line cross, not a call. The list has 149 weekly cells this week (147 last week) because the board's universe moved; the every perp view (783 markets) is not used for any count here.

// Trend state is context, not a trade signal. A cell can only change on its own timeframe close.

THE BOARD'S OWN NOTE · BARE FLIPS DID NOT SURVIVE COSTS OUT OF SAMPLE IN OUR TESTING

[I] FROZEN 19 OCT 05:18 UTC

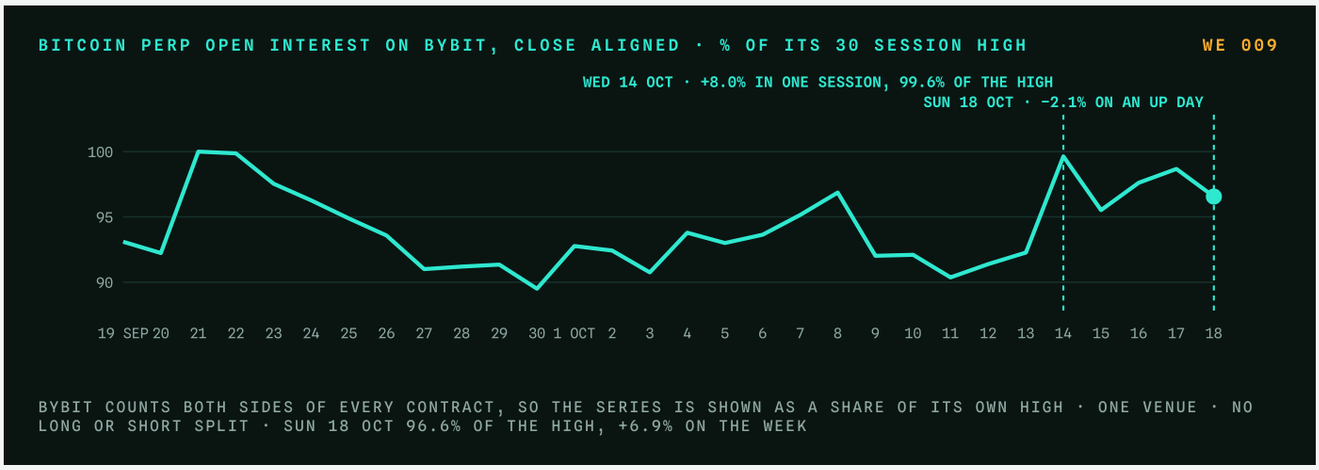

05

RESEARCH DESK · WHAT THE LANE FOUND

THE DAILY INTELLIGENCE LANE · SEVEN DAILY REPORTS AND ONE WEEKLY SYNTHESIS

Tests written in advance, two of them answered blind.

Every market day an automated research run reads the tape, our own logs and the public data, and writes down what would prove it wrong before the session that decides it. Four of this week's seven runs were on time, two were written from an aggregate price feed because the exchange was unreachable, and one was collected two days late. Here is what they found.

01 **The switch came 0.08% past the line and did not whipsaw.** The 1 October regime test asked for a change of market type on the next macro session with the triggering axis named. On Wednesday the S&P closed 0.08% under its 20 day average, both producers named it, and the board switched. The next question was whether a close that near the line would flip back the next day. It did not: Thursday closed 0.14% over the average, inside the band, and Friday closed 1.03% under it. The switch works on a band around the average, not on the sign.

02 **Open interest moved one exchange at a time, for a fourth week, now on bitcoin.** Over the week bitcoin's open interest on Bybit rose 6.9% while the same book on Binance rose 0.8%; Ether's rose 2.8% on Bybit and fell 1.6% on Binance; Solana's fell 7.7% on Bybit and rose 5.8% on Binance. Wednesday's fall added 8.0% to bitcoin's Bybit book in one session, the largest build in its 30 session window, with Binance adding 0.7%. One venue's open interest is one venue's.

03 **Shorts were paid, not squeezed, for a second week.** Funding tells you which side pays to hold a perp. After Monday's fall short sellers were paying on 37 of 76 coins, the widest count the lane has recorded; 22 of 70 after Tuesday's rebound and 20 of 69 after Wednesday's fall. Each day the paying coins moved with the tape, falling 1.4 points less on Monday, rising 1.3 points less on Tuesday and falling 0.9 points more on Wednesday. BLUR sat at its funding cap on Tuesday, shorts paying 2.0% every eight hours, and fell another 12% as the rate eased: the shorts were right.

04 **Falls added contracts and rebounds took them out.** On Bybit's hourly series, Monday's fall added 6.5% to bitcoin's book into the noon fall and shed 5.1% through the late evening fall; Tuesday's rebound covered 2.7% in four hours; Wednesday's fall added 8.0%; Thursday shed 4.1% on the day the dip was bought, a reading the lane only has from Sunday's file; and Sunday's rise shed 2.1% on Bybit and 1.2% on Binance, price up with contracts out. Which side did it cannot be read from one series.

05 **Our research lane lost two days of its own exchange data.** At 00:28 UTC on Saturday every Bybit host answered 403 with a country block and Binance futures answered 451, because the Mac's VPN tunnel exited in the United States. No snapshot exists for 15 or 16 October, both reports were written from an aggregate price feed and production's own reads, and every Bybit series the lane keeps has a two day hole. A reachability probe now runs before every collection, and the hole is printed here rather than filled.

Here is the boundary. These are our own research runs reading public data from Bybit and, for the majors, Binance. Bybit counts both sides of every contract, so we print only each venue's own percentage changes. Funding is read once a day at one instant on one venue. None of it is a forecast.

[I] FROZEN 19 OCT 05:18 UTC

06

TOOLS SHIPPED · AND THE FUNNEL

PRODUCT · WHAT WENT LIVE 12 TO 18 OCT

The statistics corrected. Sectors on the board, picks sealed.

Shipped this week: the public statistics fixes the owner approved after the 10 October audit, a sector on every Trend Board coin, the Long Desk with its sealed picks, the Cascade Radar's second rule set in shadow, the market gate chip, the member session fixes, and two heavy routes moved behind the admin key after they froze the server. Here is what each one does and what it does not.

01 **The public statistics were corrected, and we said so.** Since Friday 16 October (17:50 Brisbane time) the route simulation behind our public performance pages counts a call that ran out its time limit as closed at the first reading after the deadline instead of leaving it out, the 30 day volatility and the CoinGecko ids on the coin pages are corrected, the digest and the pages show the lanes that were in fact delivered, and the member entry state and the gate card show nothing rather than something stale when an input is missing. Nothing before the change pairs with anything after it, and the pages say so.

02 **Every Trend Board coin has a sector, and the Long Desk keeps sealed picks.** From Tuesday 13 October every coin on the Trend Board carries a sector, with a breadth strip and a filter per sector (Privacy and DePIN added). The Long Desk, an operator page for the registered study of longer holds, seals each paper pick under a hash the day it is made and reveals it 52 hours after its entry bar closes, with a public page at /verify/long-desk that shows the chain. Members see the sectors; the picks are counts only in public until the study's read on 15 December.

03 **The Cascade Radar runs a second rule set in shadow, and the market gate is on the board.** From Thursday 15 October the radar's version two rules (a hold before a coin is called trapped, a two cycle wait, scoring by stage) run beside the live rules with their alerts off, so they can be judged before a member sees them. The Trend Board shows the market gate (which lanes the regime lets through) as a chip, the closest to its yearly high sort on the daily lane, and the Telegram opportunities card carries one Market gates line. The server also raises an alarm when its event loop stalls.

04 **Members stay signed in through a hidden tab.** From Thursday 15 October a gated answer resyncs the member session instead of signing the member out, the live tape pauses while its tab is hidden and drops stale rows the moment the tab is shown, and the sign in path takes a lock so a signed in member is never shown as signed out.

05 **Two routes that froze the server now need the admin key.** On Monday 12 October two reads from our own sessions froze production for 32 and 13 seconds: the full history export and a positioning status count. Both routes now need the admin secret, and the status route counts its tables only when asked. The same morning the owner ran a review of the whole system with 28 agents and a skeptic: 149 verified findings, none refuted, in a register the weekly review works through.

06 **Five releases, one lost evening, and the stalls stayed under eleven seconds.** Production restarted five times, once on each UTC day from 12 to 16 October, under a rule of at most one restart a UTC day while two registered studies run. The Wednesday 14 October evening release aborted because a scheduled metrics pull wrote into the checkout as the train launched; the fix is in the train's own prompt. Every boot this week kept its largest event loop block under 11 seconds, against 20 to 48 seconds the week before. On Sunday the public readiness check answered "not ready" for about 70 seconds inside its hourly cycle, on a boot 65 hours old; members saw nothing we can find, and it is being read.

THE FUNNEL, MEASURED

Trial starts in the last 30 days: **1**, the first in six issues, a member who first visited on 12 October with no campaign tag on the visit, so no post or article can claim them. Subscribers: 7, of which 2 active, one of those a comped research seat. X followers 255 at the 17 October snapshot, up four from 251. Issue 007 went out on X on Monday 12 October and reached 120 impressions with 15 engagements from outside our account. Tuesday's article on ten trend rules, seven of which failed our tests, reached 1,012 impressions with 20 outside engagements, the widest reach of any post in this ledger. Issue 008 never went out on X: the owner gave tonight's slot to this issue instead, so it lives on the site only. We print this every issue so the receipts cut both ways.

FREE FOREVER

The live regime board, the full regime history, the public receipt ledger and every issue of this report.

MEMBERS ALSO GET

150 ranked coins for the current market with a sector on every one, 12 live opportunity cards, the per coin drawer, the Cascade Radar with five more exchanges beside Bybit, and the market gate on the Trend Board and on Telegram.

SENTINELRESEARCH.APP/BETA · CORE FROM $39 PER 30 DAYS

07

RECEIPTS · LOSS FIRST

THE LEDGER · SENTINELRESEARCH.APP/PERFORMANCE

Thirty one receipts. The fifteen losses first.

Thirty one calls resolved this week, fifteen lost and sixteen won, all from our CORE lane (Sweet, the one lane every subscriber receives, and the one lane Alt Risk Off lets through). Two hit their stop, three hit their target and twenty six ran out the four hour limit, thirteen below entry and thirteen above. Useless was called four times and ENA three. Net figures are after the flat 0.22% round trip cost, every row reached the public ledger within 57 minutes of firing and before it closed, and the longest quiet stretch was 23 hours from Monday early morning to Tuesday early morning UTC. We say registered, not delivered.

SIGNAL	RESOLVED OUTCOME	RESULT	NOTE
STBL	-9.22%	LOSS	Fired Sat 00:10 UTC, the week's worst, a stop in 69 minutes, and it hit its stop after 69 minutes.
ARC	-5.32%	LOSS	Fired Thu 08:10 UTC, the same coin hit its target the next morning, and it hit its stop after 119 minutes.
USELESS	-3.91%	LOSS	Fired Mon 04:58 UTC, the second of four calls on Useless, and the four hour limit ran out below entry.
CRV	-3.06%	LOSS	Fired Tue 05:32 UTC and the four hour limit ran out below entry.
PUMPFUN	-2.86%	LOSS	Fired Wed 15:03 UTC, fired while the regime switch was three hours away, and the four hour limit ran out below entry.
CHIP	-2.28%	LOSS	Fired Fri 04:17 UTC and the four hour limit ran out below entry.
AKE	-1.98%	LOSS	Fired Sun 00:05 UTC, its delivery was unconfirmed for a time and the coin paused itself, and the four hour limit ran out below entry.
CRV	-1.88%	LOSS	Fired Wed 17:03 UTC and the four hour limit ran out below entry.
PUMPFUN	-1.44%	LOSS	Fired Fri 21:15 UTC and the four hour limit ran out below entry.
HYPE	-0.84%	LOSS	Fired Fri 22:50 UTC and the four hour limit ran out below entry.
JTO	-0.69%	LOSS	Fired Thu 16:03 UTC and the four hour limit ran out below entry.
USELESS	-0.62%	LOSS	Fired Thu 20:47 UTC, registered 57 minutes after firing, the week's slowest, and the four hour limit ran out below entry.
ASTER	-0.59%	LOSS	Fired Tue 21:06 UTC and the four hour limit ran out below entry.
UNI	-0.46%	LOSS	Fired Tue 16:03 UTC and the four hour limit ran out below entry.
ZEC	-0.28%	LOSS	Fired Fri 06:17 UTC and the four hour limit ran out below entry.
ERA	+0.10%	WIN	Fired Sat 19:31 UTC and the four hour limit ran out above entry.
HBAR	+0.30%	WIN	Fired Thu 21:47 UTC and the four hour limit ran out above entry.
LDO	+0.34%	WIN	Fired Tue 20:06 UTC and the four hour limit ran out above entry.
HYPE	+0.58%	WIN	Fired Thu 15:36 UTC and the four hour limit ran out above entry.
ENA	+0.69%	WIN	Fired Thu 21:17 UTC and the four hour limit ran out above entry.
HBAR	+0.86%	WIN	Fired Sun 00:17 UTC and the four hour limit ran out above entry.
ENA	+1.10%	WIN	Fired Thu 16:47 UTC and the four hour limit ran out above entry.
POL	+1.10%	WIN	Fired Tue 04:03 UTC and the four hour limit ran out above entry.
GOAT	+1.18%	WIN	Fired Thu 16:32 UTC and the four hour limit ran out above entry.
USELESS	+1.65%	WIN	Fired Mon 00:32 UTC, the first call of the week, and the four hour limit ran out above entry.
ZEC	+1.77%	WIN	Fired Wed 01:03 UTC and the four hour limit ran out above entry.
XPL	+2.41%	WIN	Fired Sun 23:13 UTC, the last call of the week, 47 minutes before the close, and the four hour limit ran out above entry.
USELESS	+2.68%	WIN	Fired Thu 16:11 UTC and the four hour limit ran out above entry.
ARC	+5.92%	WIN	Fired Fri 07:03 UTC and it hit its target after 206 minutes.
SIREN	+6.01%	WIN	Fired Thu 15:36 UTC, the week's fastest target, 33 minutes, and it hit its target after 33 minutes.
ENA	+6.02%	WIN	Fired Thu 13:21 UTC, the first of three calls on ENA that afternoon, and it hit its target after 114 minutes.

THE BOUNDARY

Resolved signal outcomes are not exchange fills and not customer profit and loss, and thirty one outcomes is a small sample. The public gate receipts list no declined entry for the week even under Alt Risk Off: three of the four lanes it holds back are switched off for everyone, and the fourth, Super, which only Research Lab members who signed the risk note receive, has no declined row in the window. Our CORE lane's pre registered study reads no outcomes until it has 100 resolved episodes, and the lane's own count reached 93 at the Sunday close, so these are interim public receipts, which the registration allows, not that study.

[I] FROZEN 19 OCT 05:18 UTC

THE PLAYBOOK · WHAT THIS WEEK LEFT OPEN

Issue 008's five, graded. Five more, all dated.

Issue 008 set five things to watch before this week began. All five are graded below, whatever they said, including the one that could not be read because the exchange was unreachable. Then a fresh list for the week of 19 to 25 October, written now, before any of it is known. Issue 010 grades all five.

01 **The 15:00 UTC hour: noise, closed.** The test needed the 15:00 UTC hour to carry the largest hourly change in bitcoin's Bybit book on at least two of three weekdays. Monday's largest hour was 13:00 UTC and Tuesday's was 08:00 UTC, so the rule was lost by Tuesday and the lane closed it inconclusive. The weekend readings that opened it were noise on a thin book.

02 **Starknet into its token release: down 30% to the day, 51% on the week, the book unread.** Issue 008 asked for the 15 October close against the 11 October close of 0.1231. The release day closed at 0.0866 on an aggregate price feed, 30% lower, with a 32% range inside the day. Whether contracts on Bybit built or shrank into it cannot be answered: no exchange read exists for 15 or 16 October. By Sunday the coin was down 51% on the week.

03 **Ether and Solana against their weekly lines: both flipped bear.** Ether closed 9.6% under its weekly line and Solana 11.2% under at the 19 October 00:00 UTC close, so both cells flipped bear, as the test said a close under the line would do.

04 **Jev's news tags: three of seven bars cleared, the tags stay in shadow.** The read ran on Thursday 15 October with 218 attached stories against a floor of 150. The kind, new event and commentary tags cleared their bars; tone, unconfirmed and coin did not (one story was attached to a coin its headline does not name); the risk flag had too few rows to score. Only the commentary tag may be shown to members, and nothing was switched.

05 **The data plan: dropped. The radar's checkpoint: not yet.** The Saturday 17 October read found a usable Hyperliquid reading on 26 of 132 Cascade Radar episodes, 20% against a 25% floor, so the plan was dropped and the key lapsed on Monday 19 October, and the Hyperliquid blocks on member pages went with it. The radar's first registered checkpoint reads on about 20 October, so Issue 010 grades it.

THE NEXT FIVE · 19 TO 25 OCTOBER

01 **The dollar and the board, Sunday 25 October.** The dollar sat 0.13% above its 20 day average at the Sunday reading, 0.43% from the line that flips it down and prints Chop, with a typical day moving 0.24%. The S&P is 1.33% from flipping back to Rally. We print which, if either, changes the market type by the Sunday close, and on which axis.

02 **Bitcoin's weekly cell, the 26 October 00:00 UTC close.** Bull since the 24 August close and 1.3% above its line at this close, from 3.3% a week earlier. A weekly close under the line flips it bear; a close above it does not. We will print whichever one happens.

03 **The 66 bear flips and the five bull ones, a week on.** How many of the 66 cells that flipped bear at this close are still bear at the 26 October close, and whether any of the five bull flips, all thin coins that at least doubled (Q, ICNT, SIREN, PUFFER and TRUTH), is still above its line. We print the counts, not a view.

04 **The CORE lane's hundredth resolved episode.** The lane's registered study counts 93 resolved episodes at the Sunday close against a floor of 100, after adding 27 this week, so the floor is likely crossed this week. Crossing it starts nothing: the evaluation is dated about 30 November to late December, and no outcome is read before it.

05 **The research lane's repair, and the Cascade Radar's first checkpoint, 20 October.** The 15 and 16 October correction packets are owed and a reachability probe now runs before every collection; we print how many of the seven days got a full exchange read. On about 20 October the radar's first registered checkpoint reads 50 spaced ignitions against 100 matched controls.

> **HOW THIS ISSUE WAS BUILT**
>
> A scheduled task froze every source at 05:18 UTC on Monday 19 October, five hours after the week closed, derived every number from those files, wrote and rendered these pages, and opened the pull request that put them on the site, the second issue built that way. It could not fill the two days the research lane lost, so it printed the hole instead.

09

EVERY SOURCE · FROZEN 19 OCT 2026, 05:18 UTC

The receipt vault.

Everything in this issue can be pulled again from the endpoints and files below. If a number here disagrees with the live site, the site is newer, and this page tells you when we read it and how we filtered it back to the week.

LEDGER	GET /api/ledger/verify (seq 1 to 5000) and ?afterSeq=5000&throughSeq=5388 (seq 5001 to 5388), snapshot bound · head seq 5388 · hash 7e0b293334b7faf917d0fa01663e9c5db538be2e7589b4bc089bb76c3835c93c · 2,869 registered, 2,519 resolved, 0 corrected · 61 events appended in the window · read 05:18:33Z
ANCHORS	100 OpenTimestamps anchors listed, all 100 submitted, 0 with a Bitcoin confirmation in the payload. Newest anchor 119 covers seq 5379 to 5386. We print that number until it changes.
RECEIPTS	The 31 rows fired 12 to 18 Oct, filtered from the ledger by firing time · cross checked against GET /api/v1/signals/active?status=all&sinceHours=336 · read 05:18:32Z to 05:18:33Z
GATE	GET /api/regime-gate-receipts/rows?days=30&limit=100, filtered to the week (no rows) · admin regime gate impact 7 and 14 days, counts only (no tier reached its minimum) · read 05:18:28Z to 05:18:38Z
REGIME	GET /api/regime-performance snapshot.segments, 160 runs since 4 June, snapshot generated 19 Oct 01:50Z, after the window, receipts null by design · GET /api/regime/pulse-history?hours=336 · GET /api/daily-brief/latest?date= for 12 to 18 Oct · read 05:18:26Z to 05:18:37Z
TREND	GET /api/scanner/trend-board (149 weekly cells, the weekly lane had swept its 19 Oct 00:00Z close, read 05:18:31Z) · the 5 Oct and 12 Oct weekly counts from the committed Issue 007 and 008 freezes · the same weekly preset all three weeks
PRICES	Bybit v5 market kline BTCUSDT, ETHUSDT, SOLUSDT linear, intervals D and 60 · read 05:18:34Z
RESEARCH	docs/research/daily-intelligence/reports 2026-10-12 to 2026-10-18 (four on time daily runs, two catch ups written from an aggregate price feed, one collected two days late) and weekly/2026-10-18-weekly-research.md · the five market snapshot files that exist (sha256 in derived.json) supply the session table, the 78 coin count, the open interest percentages and the bitcoin series; 15 and 16 Oct have a degraded collection receipt and no market rows
PRODUCT	docs/CURRENT_STATE.md dated sections 12 to 17 Oct (the five trains, the evidence release, the sector lens and the Long Desk, Cascade v2 and the gate chip, the member session fixes, the routes behind the admin key, the Jev read, the Birdeye read) · admin subscription funnel, 7 and 30 days, counts only · X figures from the docs/growth post performance ledger (newest pull 18 Oct 22:09Z) and the 19 Oct morning growth pack
METHOD	Every live figure was read between 05:18:26Z and 05:18:39Z on 19 Oct 2026 by the scheduled task and filtered back to 12 to 18 Oct by timestamp; /ready was not read on purpose (each call blocks the live server for seconds). Raw responses are kept with URL, HTTP status, byte count and sha256; the ledger, the trend board and the admin bodies are hashed but not committed. Net returns use a flat 0.22% round trip cost; funding and slippage are not modelled. Bybit open interest is printed as percentages only.

Here is what we do not claim. We claim no trade execution, no customer profit and loss, no hit rate for the board (the public endpoint returns receipts: null on purpose), no hit rate, average or other aggregate score for any lane, and no prediction. Corrections get a new file name, and an issued PDF is never overwritten.
